Quantifier elimination for counting extensions of Presburger arithmetic

Dmitry Chistikov¹, Christoph Haase², **Alessio Mansutti**²

¹ University of Warwick, UK ² University of Oxford, UK

Presburger arithmetic

The first-order theory of $\langle \mathbb{Z}, 0, 1, +, \leq \rangle$

"Every integer is either even or odd"

$$\forall \mathtt{x}\,\exists \mathtt{y}:\mathtt{x}=2\mathtt{y}\vee\mathtt{x}=2\mathtt{y}+1$$

M. Presburger

Why Presburger arithmetic?

- Number theory is (highly) undecidable
- Presburger arithmetic is decidable [Presburger, '29]
- Wide range of applications in verification, program synthesis, compiler optimisation...
- Starting point of several algorithmic paradigms

Quantifier elimination [Presburger, '29]

$$\exists x: arphi_{\mathrm{QF}}(x,\mathbf{y}) \ \equiv \ \psi_{\mathrm{QF}}(\mathbf{y})$$
 QF: quantifier-free

Quantifier elimination [Presburger, '29]

$$\exists x : \varphi_{\mathsf{QF}}(x, \mathbf{y}) \equiv \psi_{\mathsf{QF}}(\mathbf{y})$$

QF: quantifier-free

Automata techniques [Büchi, '60]

$$z = x + y \quad \rightsquigarrow \quad \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \quad \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix}, \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix}, \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \\ \mathbf{0} \end{bmatrix} \quad \mathbf{0} \quad \mathbf{0} \end{bmatrix} \quad \mathbf{0} \quad$$

Quantifier elimination [Presburger, '29]

$$\exists x : \varphi_{\mathsf{QF}}(x, \mathbf{y}) \equiv \psi_{\mathsf{QF}}(\mathbf{y})$$

QF: quantifier-free

Automata techniques [Büchi, '60]

$$z = x + y \quad \rightsquigarrow \quad \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \quad \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0}$$

Semilinear sets [Ginsburg and Spanier, '66]

$$\begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \qquad \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} \cdot \mathbb{N} + \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \cdot \mathbb{N}$$

Quantifier elimination [Presburger, '29]

$$\exists x : \varphi_{\mathsf{QF}}(x, \mathbf{y}) \equiv \psi_{\mathsf{QF}}(\mathbf{y})$$

QF: quantifier-free

Automata techniques [Büchi, '60]

$$z = x + y \quad \rightsquigarrow \quad \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} \cdot \quad \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\$$

Semilinear sets [Ginsburg and Spanier, '66]

 $\begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} \cdot \mathbb{N} + \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \cdot \mathbb{N}$

Quantifier elimination [Presburger, '29]

$$\exists x : \varphi_{\mathsf{QF}}(x, \mathbf{y}) \equiv \psi_{\mathsf{QF}}(\mathbf{y})$$

Automata techniques [Büchi, '60]

$$(\psi, \mathbf{y}) = \psi_{\mathsf{QF}}(\mathbf{y})$$

Semilinear sets [Ginsburg and Spanier, '66]

$$\begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \qquad \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} \cdot \mathbb{N} + \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \cdot \mathbb{N}$$

QF: quantifier-free

Büchi arithmetic

Quantifier elimination [Presburger, '29]

$$\exists x: \varphi_{\mathrm{QF}}(x,\mathbf{y}) \ \equiv \ \psi_{\mathrm{QF}}(\mathbf{y})$$

Automata techniques [Büchi, '60]

$$z = x + y \quad \rightsquigarrow \quad \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \quad \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \quad \bigcirc \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \quad \bigcirc \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \quad \bigcirc \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \quad \bigcirc \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0}$$

Semilinear sets [Ginsburg and Spanier, '66]

$$\begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} \cdot \mathbb{N} + \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \cdot \mathbb{N}$$

Counting quantifiers

QF: quantifier-free

Büchi arithmetic

Quantifier elimination [Presburger, '29]

$$\exists x: \varphi_{\mathsf{QF}}(x, \mathbf{y}) \ \equiv \ \psi_{\mathsf{QF}}(\mathbf{y})$$

Automata techniques [Büchi, '60]

$$z = x + y \quad \rightsquigarrow \quad \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \quad \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \end{bmatrix} \quad \mathbf{0} \quad \mathbf{0}$$

$$\begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ \mathbf{x} + \mathbf{y} \end{bmatrix} : \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix} + \begin{bmatrix} \mathbf{1} \\ \mathbf{0} \\ \mathbf{1} \end{bmatrix} \cdot \mathbb{N} + \begin{bmatrix} \mathbf{0} \\ \mathbf{1} \\ \mathbf{1} \end{bmatrix} \cdot \mathbb{N}$$

Counting quantifiers

QF: quantifier-free

Büchi arithmetic

Applications in compiler optimisation [Verdoolaege et al., Algorithmica 48, '07]:

"How many times is a loop executed?" $\rightsquigarrow \varphi(\mathbf{z},x) \equiv x = \#\{\mathbf{y} \in \mathbb{Z}^d \mid A\mathbf{y} \geq B\mathbf{z} + \mathbf{c}\}$

Applications in compiler optimisation [Verdoolaege et al., Algorithmica 48, '07]:

"How many times is a loop executed?" $\rightsquigarrow \varphi(\mathbf{z}, x) \equiv x = \#\{\mathbf{y} \in \mathbb{Z}^d \mid A\mathbf{y} \geq B\mathbf{z} + \mathbf{c}\}$

Counting quantifiers:

 $\exists^{=x}\mathbf{y}: \varphi(\mathbf{y},\mathbf{z},x)$ "there are x many distinct vectors \mathbf{y} that satisfy φ "

Applications in compiler optimisation [Verdoolaege et al., Algorithmica 48, '07]:

"How many times is a loop executed?" $\rightsquigarrow \varphi(\mathbf{z}, x) \equiv x = \#\{\mathbf{y} \in \mathbb{Z}^d \mid A\mathbf{y} \geq B\mathbf{z} + \mathbf{c}\}$

Counting quantifiers:

$$\exists^{=x} \mathbf{y} : \varphi(\mathbf{y}, \mathbf{z}, x)$$
 "there are x many distinct vectors \mathbf{y} that satisfy φ "

Theorem (folklore)

Presburger arithmetic enriched with counting quantifiers is undecidable.

Applications in compiler optimisation [Verdoolaege et al., Algorithmica 48, '07]:

"How many times is a loop executed?" $\rightsquigarrow \varphi(\mathbf{z}, x) \equiv x = \#\{\mathbf{y} \in \mathbb{Z}^d \mid A\mathbf{y} \geq B\mathbf{z} + \mathbf{c}\}$

Counting quantifiers:

$$\exists^{=x}\mathbf{y}: \varphi(\mathbf{y},\mathbf{z},x)$$
 "there are x many distinct vectors \mathbf{y} that satisfy φ "

Theorem (folklore)

Presburger arithmetic enriched with counting quantifiers is undecidable.

Proof.

$$\varphi(x,y,z) \stackrel{\text{\tiny def}}{=} \exists^{=x}(a,b): 1 \leq a \leq y \land 1 \leq b \leq z \quad \text{if and only if} \quad x = y \cdot z.$$

Applications in compiler optimisation [Verdoolaege et al., Algorithmica 48, '07]:

"How many times is a loop executed?" $\rightsquigarrow \varphi(\mathbf{z}, x) \equiv x = \#\{\mathbf{y} \in \mathbb{Z}^d \mid A\mathbf{y} \geq B\mathbf{z} + \mathbf{c}\}$

Counting quantifiers:

 $\exists^{=x} \mathbf{y} : \varphi(\mathbf{y}, \mathbf{z}, x)$ "there are x many distinct vectors \mathbf{y} that satisfy φ "

Unary counting quantifiers:

 $\exists^{=x}y: \varphi(x,y,\mathbf{z})$ "there are x many distinct integers y that satisfy φ "

Theorem (Apelt, '66; Schweikardt, '05)

Presburger arithmetic enriched with unary counting quantifiers is decidable.

Examples

"The number of y satisfying φ is congruent to r modulo q"

$$\exists x: (\exists z: x-r=q\cdot z) \wedge \exists^{=x} y: \varphi$$

Examples

"The number of y satisfying φ is congruent to r modulo q"

$$\exists x: (\exists z: x-r=q\cdot z) \land \exists^{=x}y: \varphi$$

"The number of y satisfying φ is the product of all primes in the interval $[2,2^{2^n}]$ "

$$\exists x: \ell_n(x) \wedge \exists^{=x} y: \varphi$$

 $\left(\ell_n(x): x \text{ is the product of all primes in } [2,2^{2^n}]; \text{ formula polynomial in } n \right)$

Input: A Presburger formula φ featuring unary counting quantifiers.

Output: A solution for φ , or \bot if no solution exists.

Upper bound: TOWER [Schweikardt, '05]

- quantifier elimination procedure
- $\bullet \ \exists^{=x} y : \varphi_{\mathsf{QF}} \ \rightsquigarrow \ \psi_{\mathsf{PA}} \ \rightsquigarrow \ \psi_{\mathsf{QF}}$
- each "⋄→" costs one exponential

Lower bound: 2AEXP_{POLY}

 same as (standard) Presburger [Fischer and Rabin, '74]

Input: A Presburger formula φ featuring unary counting quantifiers.

Output: A solution for φ , or \bot if no solution exists.

Upper bound: TOWER [Schweikardt, '05]

- quantifier elimination procedure
- $\bullet \ \exists^{=x} y : \varphi_{\mathsf{QF}} \ \rightsquigarrow \ \psi_{\mathsf{PA}} \ \rightsquigarrow \ \psi_{\mathsf{QF}}$
- each "→" costs one exponential

Lower bound: 2AEXPPOIX

same as (standard) Presburger
[Fischer and Rabin, '74]

Modulo counting quantifiers:

$$\exists^{(q,r)}y:\varphi \quad \equiv \quad \exists x:x\equiv_q r \land \exists^{=x}y:\varphi$$

"The number of y satisfying φ is congruent to r modulo q"

Input: A Presburger formula φ featuring unary counting quantifiers.

Output: A solution for φ , or \bot if no solution exists.

Upper bound: TOWER [Schweikardt, '05]

- quantifier elimination procedure
- $\bullet \ \exists^{=x} y : \varphi_{\mathsf{QF}} \ \rightsquigarrow \ \psi_{\mathsf{PA}} \ \rightsquigarrow \ \psi_{\mathsf{QF}}$
- each "⋄→" costs one exponential

Lower bound: 2AEXP_{POLY}

 same as (standard) Presburger [Fischer and Rabin, '74]

Theorem 1 (Habermehl and Kuske, FOSSACS'15)

Presburger arithmetic enriched with $\exists^{(q,r)}$ is decidable in 2ExpSpace.

Input: A Presburger formula φ featuring unary counting quantifiers.

Output: A solution for φ , or \bot if no solution exists.

Upper bound: TOWER [Schweikardt, '05]

- quantifier elimination procedure
- $\bullet \ \exists^{=x} y : \varphi_{\mathsf{QF}} \ \rightsquigarrow \ \psi_{\mathsf{PA}} \ \rightsquigarrow \ \psi_{\mathsf{QF}}$
- each "⋄→" costs one exponential

Lower bound: 2AEXP_{POLY}

same as (standard) Presburger
[Fischer and Rabin, '74]

In this paper: Revised quantifier elimination procedure for PAC (= PA + $\exists^{=x}$):

- elimination of a single $\exists^{=x}$ costs one exponential
- shows 2ExpSpace membership for a fragment of PAC that generalizes $\exists^{(q,r)}$.

Input: A set T of linear terms in d variables. **Output:** A tautology $\bigvee_{i=1}^{o} O_i$ where O_i is an ordering of terms.

Ordering: $t_1 \leq t_2 \leq \cdots \leq t_n$ with $T = \{t_1, \dots, t_n\}$.

Input: A set T of linear terms in d variables. **Output:** A tautology $\bigvee_{i=1}^{o} O_i$ where O_i is an ordering of terms.

Ordering: $t_1 \leq t_2 \leq \cdots \leq t_n$ with $T = \{t_1, \dots, t_n\}$.

Lemma

The number of orderings is bounded by $n^{O(d)}$.

Input: A set T of linear terms in d variables. **Output:** A tautology $\bigvee_{i=1}^{o} O_i$ where O_i is an ordering of terms.

Ordering: $t_1 \leq t_2 \leq \cdots \leq t_n$ with $T = \{t_1, \dots, t_n\}$.

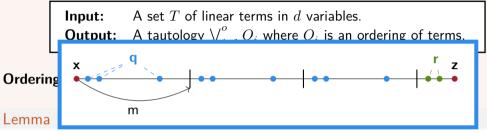

Lemma

The number of orderings is bounded by $n^{O(d)}$.

A Boolean combination φ of constraints $y = r_i \mod m$. Input:

Output: A function f(x,z) that returns $\#\{y\in[x,z]\mid y$ satisfies $\varphi\}$.

Note: given residue classes of x and z mod m, f(x,z) is of the form $q \left| \frac{z-x}{r} \right| + r$.

The number of orderings is bounded by $n^{O(d)}$.

Input: A Boolean combination φ of constraints $y = r_j \mod m$.

Output: A function f(x,z) that returns $\#\{y\in[x,z]\mid y$ satisfies $\varphi\}$.

Note: given residue classes of x and $z \mod m$, f(x,z) is of the form $q\lfloor \frac{z-x}{m} \rfloor + r$.

The source of "towerness":

ullet First step of the procedure normalises the coefficients of y to -1 or 1.

Our QE procedure translate $\exists^{=x_1}y:\varphi(y,x_1,\ldots,x_d)$ into

- ullet L (e.g. if there are infinitely many y satisfying φ), or
- a formula of the form

$$\bigvee_{\substack{i \in [1,o] \\ f: \{x_1,\dots,x_d\} \rightarrow [0,m-1]}} \underbrace{t_1^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ ordering}} \wedge \Big(\underbrace{\bigwedge_{j=1}^d x_j \equiv_m f(x_j)}_{\text{ residue classes}} \Big) \wedge \underbrace{m \cdot x_1 = \sum_{k=1}^{n-1} q_k^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting}} + \underbrace{k_1^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ ordering}} \wedge \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ residue classes}} + \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ counting}} + \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ ordering}} + \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ ordering}} + \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ residue classes}} + \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ ordering}} + \underbrace{k_2^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ orde$$

The source of "towerness":

- First step of the procedure normalises the coefficients of y to -1 or 1.
- This adds a constraint $y \equiv_C 0$ where C is the LCM of all coefficients of y.

Our QE procedure translate $\exists^{=x_1}y:\varphi(y,x_1,\ldots,x_d)$ into

- ullet L (e.g. if there are infinitely many y satisfying φ), or
- a formula of the form

$$\bigvee_{\substack{i \in [1,o] \\ f: \{x_1,\dots,x_d\} \rightarrow [0,m-1]}} \underbrace{t_1^{(i)} \leq \dots \leq t_n^{(i)}}_{\text{ ordering }} \wedge \Big(\underbrace{\bigwedge_{j=1}^d x_j \equiv_m f(x_j)}_{\text{ residue classes }} \Big) \wedge \underbrace{m \cdot x_1 = \sum_{k=1}^{n-1} q_k^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^{(i)} - t_k^{(i)}) + r_k^{(i,f)}}_{\text{ counting }} + \underbrace{\sum_{j=1}^{n-1} q_j^{(i,f)}(t_{k+1}^$$

The source of "towerness":

- ullet First step of the procedure normalises the coefficients of y to -1 or 1.
- This adds a constraint $y \equiv_C 0$ where C is the LCM of all coefficients of y.
- A priori, across all orderings and residue classes, there are a lot of distinct coefficients in the counting part of the output formula.

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\psi(x,\mathbf{z}) \ \equiv \ \bigvee\nolimits_{i \in I} \psi_i(x) \wedge \gamma_i(\mathbf{z}).$$

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\psi(x,\mathbf{z}) \ \equiv \ \bigvee\nolimits_{i\in I} \psi_i(x) \wedge \gamma_i(\mathbf{z}).$$

Examples:

"The number of y satisfying φ is congruent to x' modulo q"

$$\exists x: x \equiv_q x' \land \exists^{=x} y: \varphi$$

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\psi(x, \mathbf{z}) \equiv \bigvee_{i \in I} \psi_i(x) \wedge \gamma_i(\mathbf{z}).$$

Examples:

"The number of y satisfying φ is congruent to x' modulo q"

$$\exists x: \bigvee\nolimits_{r \in [0,q-1]} x \equiv_q r \land r \equiv_q x' \land \exists^{=x} y: \varphi$$

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\psi(x,\mathbf{z}) \ \equiv \ \bigvee\nolimits_{i\in I} \psi_i(x) \wedge \gamma_i(\mathbf{z}).$$

Examples:

"The number of y satisfying φ is congruent to x' modulo q"

$$\exists x : x \equiv_q x' \land \exists^{=x} y : \varphi$$

"The number of y satisfying φ is the product of all primes in $[2,2^{2^n}]$ "

$$\exists x: \ell_n(x) \land \exists^{=x} y: \varphi$$

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\psi(x,\mathbf{z}) \ \equiv \ \bigvee\nolimits_{i\in I} \psi_i(x) \wedge \gamma_i(\mathbf{z}).$$

Examples:

"The number of y satisfying φ is congruent to x' modulo q"

$$\exists x : x \equiv_q x' \land \exists^{=x} y : \varphi$$

"The number of y satisfying φ is the product of all primes in $[2,2^{2^n}]$ "

$$\exists x: \ell_n(x) \wedge \exists^{=x} y: \varphi$$

Note I: any Presburger formula with one free variable is monadically decomposable.

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

$$\psi(x,\mathbf{z}) \ \equiv \ \bigvee\nolimits_{i\in I} \psi_i(x) \wedge \gamma_i(\mathbf{z}).$$

Examples:

"The number of y satisfying φ is congruent to x' modulo q"

$$\exists x: x \equiv_q x' \land \exists^{=x} y: \varphi$$

"The number of y satisfying φ is the product of all primes in $[2,2^{2^n}]$ "

$$\exists x: \ell_n(x) \land \exists^{=x} y: \varphi$$

Note II: monadic decomposability for PA is decidable [Libkin, TOCL'03].

$$\exists x: \psi(x, \mathbf{z}) \land \exists^{=x} y: \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x:

Theorem

The monadically-guarded fragment of PAC is in $2\mathrm{ExpSpace}$.

$$\exists x : \psi(x, \mathbf{z}) \land \exists^{=x} y : \varphi(y, \mathbf{z})$$

where ψ is monadically decomposable on x.

Theorem

The monadically-guarded fragment of PAC is in 2ExpSpace.

What about 2AExp_{Poly}-complete fragments? Yes, as long as each monadic guard ψ has all solutions of magnitude doubly exponential in $|\psi|$.

Conclusion

In this paper: New quantifier elimination procedure for PAC:

- \bullet elimination of a single $\exists^{=x}$ costs one exponential
- ullet shows 2ExpSpace membership for the monadically-guarded fragment.

Conclusion

In this paper: New quantifier elimination procedure for PAC:

- elimination of a single $\exists^{=x}$ costs one exponential
- ullet shows 2ExpSpace membership for the monadically-guarded fragment.

One take-away message: The concept of monadic decomposition brings strong complexity advantages (see also [Libkin, TOCL'03]).

Conclusion

In this paper: New quantifier elimination procedure for PAC:

- elimination of a single $\exists^{=x}$ costs one exponential
- shows 2ExpSpace membership for the monadically-guarded fragment.

One take-away message: The concept of monadic decomposition brings strong complexity advantages (see also [Libkin, TOCL'03]).

Wide open problem: Exact complexity of PAC is still not known.
